

NI Trader — Results Brief

Current results on all 24 markets — freshly downloaded two-year windows, evaluated 8–9 August 2026

AI Atlas Inc. · Natural Intelligence (NI) pioneers · Ontario, Canada · [aiatlasinc.ca](#)

The engine today, one line each

Certified configuration — passed every pre-set condition on all 24 markets, twice: at the July certification and again on fresh data in August, at 1×, 2× and 3× leverage.

24 / 24 MARKETS PROFITABLE	93.3% WINNING TRADES	−0.6% WORST SINGLE TRADE	+18.6% AVG PER MARKET	re-verified AUG 2026 · FRESH DATA
--	--	--	---	---

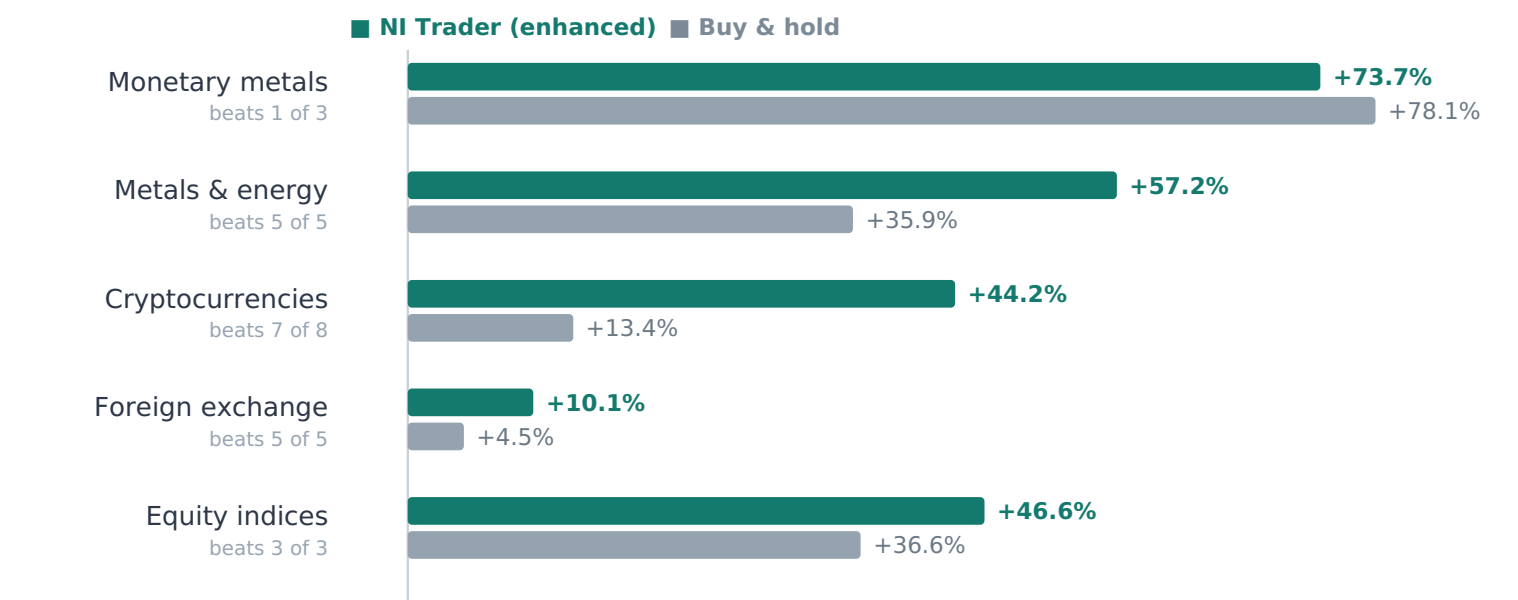

Certified risk configuration at its tested 2× setting. Identical figures on July and August windows.

Enhanced configuration — the engine's staged risk mode (three-portion entries, half the position banked at a first objective, the rest allowed to run). Same signals, richer execution. Its current result on the fresh 24-market set:

21 / 24 BEATS BUY & HOLD	94% WINNING TRADES	+43.8% AVG VS MARKET +27.2%	+72.8% AVG AT 3× LEVERAGE
--	--	---	---

Enhanced (research) configuration at 2× unless noted; 102 trades across 24 markets. Not yet gate-certified — see the honesty box overleaf.

Where it stands by category — enhanced vs the market

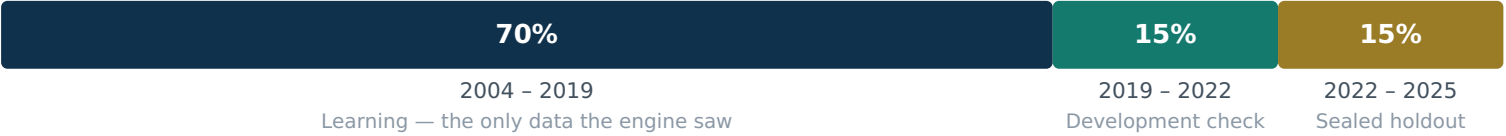

Average return per market within each category at 2×. Wins four of five categories outright and effectively ties the fifth.

How the engine learned — and how the test was designed to be hard

The engine was allowed to learn from **one instrument only**: gold, at hourly resolution — 122,028 observations spanning June 2004 to June 2025, a record that contains the 2008 crisis, the 2011–2015 bear market, the 2020 shock and the 2022 inflation cycle. That record was split strictly by time:

Gold, hourly — 122,028 observations, June 2004 to June 2025

Learning used only the first segment. The later segments were reserved: one as a development check, and the most recent three years **sealed** — consulted exactly once, at the very end, as a veto no development choice could have been tuned against.

The blind test. The trained engine was then run on **24 scenarios: 23 markets it had never seen** — metals, energy, currencies, digital assets, equity indices — **plus one unseen window of gold itself**. Pass conditions were fixed in writing before the test (the equivalent of pre-registration):

#	Condition, set in advance	What it rules out
1	At least 70% of all trades profitable	Systems that survive on rare outsized wins.
2	Not one of the 24 scenarios may end negative	Averaging one disaster away against strong results.
3	No single trade worse than –15%	Survival by luck on an uncontrolled loss.

AND THEN THE WHOLE TEST WAS RUN TWICE

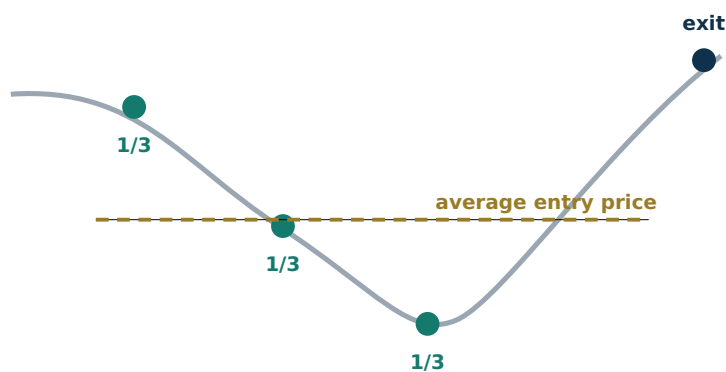

The certification was earned in July 2026. On 8–9 August 2026 every market was **re-downloaded on fresh two-year windows** and the whole evaluation repeated end to end on a different machine. The certified configuration met all three conditions again, at 1×, 2× and 3× leverage, with the same headline figures — 93.3% winning trades, +18.6% average per market. A result that replicates on new data is the strongest evidence a backtest can offer.

Term	Meaning as used here
Buy & hold	Buy at the start of the window, sell at the end — the benchmark every result is compared against.
Out-of-sample	Data the engine never saw while learning. Every result in this brief is out-of-sample.
Leverage (2×, 3×)	Trading with amplified exposure: every gain <i>and every loss</i> is multiplied by that factor.
Drawdown	The largest interim decline from a peak before recovery — the discomfort along the way, even in a trade that ends profitably.

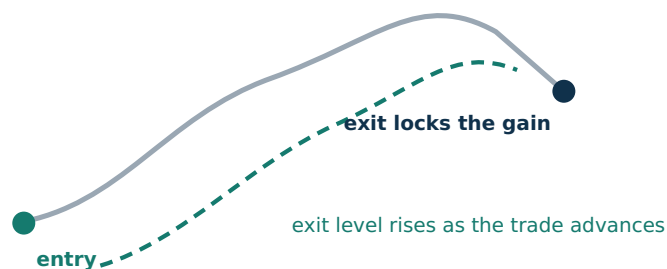

How the enhanced configuration trades

The enhanced configuration uses the same signals as the certified engine, with two pieces of professional risk machinery on top. Both are simple to state.

Staged entry — three portions, not all-in

Trailing exit — gains are defended

Each deeper portion lowers the average price — the recovery needed to profit shrinks.

A retreat only ever surrenders part of an open profit — never the account.

- **Staged entry — cost averaging in three portions.** Instead of committing everything at one price, the position is built in up to three parts, each added only if the market moves *against* the first. Every addition lowers the average entry price, so the recovery needed to reach profit shrinks. With a signal that is right roughly nine times in ten, an early adverse move is usually noise before the real move — staging converts that noise into a better price instead of a loss.
- **Half banked, half allowed to run.** When the position reaches a first objective, half is realised — profit safely in hand — while the remaining half stays in for as long as the engine's reading holds, capturing the long trends a fixed target would cut short. This is why the enhanced engine could return +296% on a market that itself rose +143%.

WHY THIS PAIRING SUITS THIS PARTICULAR ENGINE

Risk machinery is cheap insurance when the underlying signal is usually right: across the fresh 24-market test the enhanced configuration won **94% of its 102 trades**. The staging protects the entry; the half-and-run structure protects the profit while leaving the upside open. Nothing about the decision engine itself changes — only how its decisions are expressed as positions.

Enhanced configuration at 2x leverage, fresh two-year windows ending August 2026. Green: NI Trader ahead of the market. Red: behind.

READ THIS HONESTLY — FIVE LINES

- 1 Every figure is a historical backtest on real downloaded data — not live performance, and not a forecast.
- 2 The enhanced configuration is **research, not yet certified**: it trails the market on three of the 24, its worst market lost -45.9% at 2x, and its worst single trade lost 47% before leverage.
- 3 The certified configuration remains the only one to pass every pre-set condition — and it passed them again on fresh August data at all three leverage settings.
- 4 At 3x the enhanced averages +72.8% but rides materially deeper drawdowns; leverage multiplies losses identically.
- 5 A continuously published, tamper-evident live record is running; certification of the enhanced configuration against the same pre-set conditions is the next scheduled result.
